

Supplementary Figure 2. Volume changes in the globus pallidus and putamen during the follow-up. Normalized MRI of the same female PKAN patient in coronal (upper images) and transversal (lower images) projections showing a normal-sized basal ganglia at the age of 12 years (left images) and volume reductions of 0.26 cm³ in the globus pallidus and 1.72 cm³ in the putamen at the age of 19 years (right images).
